

## **Permanon Application Instructions**

1. **CLEAN:** It is best to work in the shade. It's essential that the surface to be protected with Permanon is clean. Do not use cleaners that contain brighteners, waxes, polymers, or other surface products that leave a residue. Permanon works *best* on smooth clean surfaces.
2. **MIX:** Shake the Permanon concentrate well. Mix\* the Permanon concentrate with water at a ratio of twenty parts water to one part Permanon for a 5% solution. *If you are using a 16oz JetShine spray bottle fill the bottle to the Permanon line with Permanon and then fill to the top with water.*
3. **MIST:** The surface should not be hot. Apply Permanon using a "fine mist" spray. Using too much Permanon will not harm the surface; it will just be a waste of product.
4. **DRY:** Wipe off the surface with a clean micro-fiber towel. No buffing is required. Permanon should not be allowed to air dry on a surface since the minerals in the water tend to leave spots. Spray only as much as you can dry before the Permanon dries; a 3'x3' area is a good starting point.

### **Notes:**

Store your unused Permanon out of direct sunlight in a location that is above freezing and below 105°F. Permanon concentrate has a shelf life of approximately two years before it gradually starts to lose some of its effectiveness.

\*Permanon mixed with tap water has a shelf life of approximately three weeks. Permanon mixed with distilled water has a shelf life of approximately three months. *We recommend using distilled water and mixing only the amount that you will use in that timeframe.* If you have any left in your spray bottle you can apply it on sinks, counters, shower doors, lawn mowers, or any other clean hard surface.

Once you are done applying Permanon we suggest you rinse out the empty spray bottle and let it air dry so it is ready for your next application.
